

Role & Access

Who can see, create, edit, and deactivate what — across Warehouse, Customer, SKU, and User Master.

Effective 24 Aug 2026 ● Verified 37 / 37 automated checks Scope Master data only – transactional modules not yet built

Roles	Hierarchy	Visibility	Editing	Login	Not built yet
-------	-----------	------------	---------	-------	---------------

Four roles, one ladder

Every person in a client company holds exactly one role — no per-warehouse variance. A fifth role, Super Admin, sits above all of this at platform level and isn't part of this reference (no controlled way to create one exists yet).

Company Admin The client's warehouse team lead, or the account created at registration. All warehouses, full company.	Warehouse Manager Runs one or more specific warehouses. Full access, but only within their own.	Warehouse Supervisor Inbound / Outbound / Inventory / Shift — or one generic role, if the client doesn't split it. Same warehouses as their Manager, view-only.	Operator Packing, picking, putaway, loading. No master-data access — their screen is a future handheld task view.
--	--	--	--

Each role manages the rung below it

Company Admin is the one exception — it can also create another Company Admin, for client teams that want more than one administrator. The same rule governs *editing* and *deactivating* an existing account, plus one more condition: the target has to share a warehouse with the person acting on them (Admin is exempt — full company reach).

No invite-link flow

Whoever creates an account sets its password directly, the same way company registration already works. There's no email-sending infrastructure in this project — the new login is shared out-of-band (in person, over chat) and works immediately.

Editing your own account

Everyone can update their own name and password once logged in. Two things stay off-limits even on yourself: your role can never be changed on your own account (so nobody, Admin included, can accidentally demote themselves out of the only admin seat), and your login ID is locked in the moment your account is created.

Onboarding at scale

User Master has the same bulk Excel import as Warehouse, SKU, and Customer Master — for adding dozens of Operators at once instead of one at a time. It follows the same rules as the manual form: you can only import a role you're allowed to create, into a warehouse you yourself have access to.

Activity tracking

Every login is now recorded, permanently. The User Master list shows how many days an account has existed ("Days Active") and when it was last used to log in ("Last Login", or "Never" if it hasn't been yet). This is first-level capture — the raw history exists now, but the actual manpower-attendance report (a proper daily attendance view built from it) is a next step, not built yet.

Warehouse and Customer are scoped. SKU isn't.

A SKU isn't owned by one warehouse — the same product moves through several — so restricting its visibility per-warehouse wouldn't make sense. Warehouse and Customer data *is* naturally warehouse-specific, and this is also the privacy boundary: staff at one warehouse shouldn't see another warehouse's 3PL or customer details.

	COMPANY ADMIN	WAREHOUSE MANAGER	WAREHOUSE SUPERVISOR	OPERATOR
Warehouse Master	● All warehouses	● Own warehouse(s)	● Own, view-only	● No access
Customer Master	● All customers	● Linked to own warehouse(s) Unlinked customers stay hidden until an Admin/Manager links them	● Same, view-only	● No access
SKU Master	● Full catalog	● Full catalog	● Full catalog, view-only	● No access
User Master	● Everyone	● Self + shared-warehouse people	● Same, view-only	● No access

● Full access ● Scoped to own warehouse(s) ● View-only ● No access

Supervisor never edits. Nobody but Admin deletes.

Same shape as visibility, minus one more line: even within their own scope, Supervisor can look but never touch. Deleting a record — or wiping a whole list with Delete All — is tighter again: Company Admin only, no exceptions, not even Manager.

	COMPANY ADMIN	WAREHOUSE MANAGER	WAREHOUSE SUPERVISOR	OPERATOR
Create / edit records	Yes	Yes, within scope	No	No
Delete / Delete All	Yes	No	No	No

The Function Tag field

Creating a Supervisor or Operator has an optional free-text tag — **Inbound Sup** , **Shift Sup** , **Picking** , or one combined tag for a client that doesn't split the role. It's descriptive only, for future KPI reporting and task routing. It changes nothing about what that person can see or do today — real per-function access differences are a separate, later phase.

Email for the office. An ID for the floor.

Company Admin and Warehouse Manager accounts log in with a real email address. Warehouse Supervisor and Operator accounts log in with any unique ID — **AAA** , **BBBB** — since shop-floor staff often don't have a work email. Every login, either shape, is guaranteed unique across the whole system, which is what makes per-person KPI tracking possible later: nobody can ever share a login.

Fixed rules today, on purpose

Everything on this page is one fixed rule set, identical for every client company. A few things were raised and deliberately set aside rather than built now:

- **A client-configurable permission system.** Letting each client toggle these rules for themselves was discussed and consciously postponed — worth building once it's clear which rules actually need to vary client-to-client, rather than a settings screen nobody ends up touching.
- **Network-restricted logins.** Locking an ID-based (Supervisor/Operator) login to the client's own warehouse network. No such infrastructure exists yet.
- **Zone-level task assignment.** "Assign this pick to an operator in my zone" depends on the Locations/Bins module, which hasn't been built.
- **Super Admin account creation.** Still no controlled way to create the platform-level role.

Verified via a disposable throwaway test company (created, exercised, and fully deleted — never real data) — creation hierarchy, warehouse-scoped visibility, cross-warehouse denial, self-deactivation denial, and the email-vs-ID login rule. 37 checks passing 24 Aug 2026; a second pass the same day added 19 more (self-edit access, self-role-change block, login-ID immutability, multi-warehouse-subordinate edit preservation, bulk import allow/deny) after a self-review caught four gaps in the first build; a third pass confirmed deactivating someone now invalidates their login on the very next request, not up to 8 hours later; a fourth confirmed every login (and only a successful one) is recorded permanently and surfaced as Days Active / Last Login — all fixed and reverified before this page was last updated.
