

WMS Build Roadmap

Warehouse Management System — build pipeline snapshot

as of 2026-09-13

Master Data → Yard & Gate → Inbound → Putaway → Inventory → Outbound → Picking → Dispatch → Returns → Analytics

■ Built ■ Started ■ Not started

What's landed since the last refresh (2026-09-06)

Inventory — the first real "on-hand" screen

Line Items (per bin/pallet) + SKU Summary, both derived live off the stock ledger, reusing the existing per-warehouse ABC/FMS classification. No new schema.

Every storage type now has real bin-suggestion logic

ASRS removed entirely (real installs run their own WCS/WES). Stillage got its own physical redesign + placement logic, mirroring Ground/Floor's own rewrite. Rack gained Aisle Rank (A/B/C) + Level Rank (F/M/S) — independent axes.

Transaction-level ledger export

Every individual inward/outward movement, downloadable for any date range — signed quantity, human-readable labels, a company-wide download for Company Admins, and real **From/To Location** columns (both endpoints shown for genuine transfers like Putaway; every other row fills whichever side its direction implies).

FMS×ABC combined classification, placement & ranking

Order-count-driven F/M/S tiers combined with ABC into one placement priority score; Ground gained a Priority Gradient + literal 1–9 Bin Rank visual; dock-zone numberOneNearDock fixed a real row-axis ambiguity.

Analytics — Daily Inward Volume (the app's first real charts)

Genuinely-new stock entering the warehouse (Receipt + Return In — Putaway's own internal transfer is deliberately excluded so nothing is double-counted), charted daily in units and distinct pallets. Outward stays deferred until Picking/Dispatch write real movements.

Data-integrity false alarm, retracted the same day

A suspected 632 "duplicate" Location rows claim on warehouse TNR8 was re-checked directly against live data and found to be zero duplicates — a DB-level unique constraint makes true duplication impossible. No cleanup was ever needed.

Module-by-module status

MODULE	STATUS	SUMMARY
Master Data	Built	Warehouses (network-node master: Factory/DC/CNF/Cross-dock), SKUs, Customers, Locations (with a full 3D Plan View), Users — all with role-scoped access and standard import/export.
Yard & Gate	Built	Gate In/Out, dock assignment, document checks, real compass-direction dock zones + a live-rotating 3D compass overlay. One competitor-research pass done (self-check-in + physical inspection flagged, not built).
Inbound	Built	Order maker + Excel bulk import + ERP push, vehicle-matched orders, scan-based receiving, Complete Inward Process/Dock Out, per-dock default staging locations.
Putaway	Built	Real bin-suggestion logic for every storage type (Rack/SPR, Drive-in, Ground/Floor, Stillage) — ABC/FMS-aware, reservation-aware, dock-relative. Pallet consolidation, Pick Face for SPR, operator-assignment fairness, Aisle/Level Rank visuals. Open: cancel path, queue ordering, Pick Face for the other storage types.
Inventory	Started	On-hand Line Items + SKU Summary views, a transaction-level ledger export (with From/To Location), and the inward half of a daily Analytics dashboard — all live-derived, no stored counters. Outbound-driven "outward" reporting waits on Picking/Dispatch.
Outbound	Not started	Schema exists; order maker with capacity checks (weight + volume) and pick-list generation not yet designed.
Picking	Not started	Nothing built yet. Task Interleaving is flagged HIGH PRIORITY for the moment this starts — a deliberate revisit of an earlier "let Analytics compare, decide later" call.
Dispatch	Not started	Nothing built yet.
Returns	Not started	Nothing built yet.
Analytics	Started	Operator productivity (marrying/putaway time per operator, Pick Face trip time, abandoned-claim flags) plus the new Daily Inward Volume charts — this app's first real charting page. Distinct from the earlier one-off Insights page.

Immediate candidates for the next session

Live options on the table — not a forced order.

1. **The reslotting/consolidation suggestion engine.** Now genuinely unblocked — both the ABC-classification and dock-relative-placement work it depended on are built. Schema has sat ready; the actual detect-a-misplaced-SKU/suggest-a-target-bin algorithm and its daily job still need designing.
2. ~~FMS classification combined with ABC~~ — **BUILT.** Ground's combined-priority placement (Priority Gradient / Bin Rank visuals) also built, then Stillage's own version, then Rack's Aisle Rank (A/B/C) + Level Rank (F/M/S). ASRS removed as a storage type entirely the same day (real installs run their own WCS/WES).
3. ~~Inventory (basic on-hand view)~~ — **STARTED & BUILT.** Line Items + SKU Summary, then the transaction-level ledger export (signed quantity, no running balance, human labels, company-wide download for Company Admins, From/To Location for real transfers), then the Analytics module's Daily Inward Volume charts (inward-only — Receipt + Return In, deliberately excluding Putaway In to avoid double-counting). **Outward chart still open** — genuinely blocked on Picking/Dispatch writing real movements.
4. **Outbound order maker** — destination + vehicle capacity check (weight and volume), triggering a pick list. Benefits from Inventory existing first.
5. **Dock-out → Gate-out signal** — an active notification once paperwork time after dock-out has genuinely elapsed. Needs a real design conversation first.
6. **Dock + Staging + Yard visualizer** — paused mid-conversation; needs a spatial-data pass first (Dock Doors/Yard Slots have no position data today).
7. **A cancel/void path for a mistaken Gate In** — flagged, not designed.
8. ~~TNR8's 632 "duplicate" Location rows~~ — **RETRACTED, false alarm.** A DB-level unique constraint makes true duplication impossible; nothing needed touching.

Deferred, lower priority — per explicit client calls, don't build unprompted

From the top-WMS gap check (vs. Blue Yonder / Manhattan / industry norms)

- **Task Interleaving** — the one exception on this list: **raise it the moment Picking starts**, not just "someday."
- Cycle counting / physical inventory reconciliation — no workflow exists at all yet.
- 3PL / client billing — a real gap against the multi-company SaaS goal; no rate cards or invoicing today.
- Vendor/Supplier master data — receiving is tied to a Vehicle, not to a vendor.
- Kitting/Assembly logic — schema exists, zero logic built.
- Quality Control / Inspection workflow — no formal hold→inspect→release/reject module.

Putaway follow-ons

- A cancel/exception path for a task that can't be completed.
- Correcting an already-completed mis-putaway.
- Real queue-ordering / aging-based task prioritization.
- Pick Face for Drive-in / Ground / Stillage (SPR-only today, deliberately).
- Pallet reuse (needs Picking to ever deplete a load).

Everything else explicitly parked

- Self-service driver check-in, Yard Plan View (no spatial data yet).
- Closing a short receipt (no discrepancy close-out path today).
- Batch/Lot + expiry capture — deferred to when Inventory's own design revisits it.
- Real GS1/unique-barcode parsing, camera-based scanning.
- Real SMS/Email/WhatsApp/Voice providers — every channel is a logging stub today.
- Dock Scheduling algorithm — only its eventual output has anywhere to land.
- Blacklist enforcement at Gate In, a general analytics dashboard, WMS/TMS integration — explicitly parked.
- SUPER_ADMIN account creation, a configurable permission matrix, a company-admin invite-link flow.
- Inventory Control Policy (min/max, reorder point, FIFO/FEFO/LIFO), Opening Balance load.
- Dispatch-proximity distance calculation, real SAP/ERP integration, cloud/production deployment.
